DOI: 10.56678/iahf-spl2022.2

The present study analyses the gender differences in work participation and decision making in agricultural and non-agricultural activities in Sikkim. A comprehensive survey was undertaken by using multi stage random sampling method to collect data from four different villages in Sikkim viz. Upper Legship village from Rabong block, South district comprising of 46 households; Bop village from Chungthang block, North district containing 25 households; Nazitam village from Martam block, East district constituting of 79 households and Lagay village from Gyalshing block, West district comprising of 62 households. . It was found that women in the sample villages in Sikkim participated in agricultural as well as non-agricultural activities at par with her male counterpart. There was not a single activity, which was absolutely dominated by male or female in the agricultural sector however slight variation was observed in work participation. Ploughing, the activity, which in earlier times, were completely dominated by men had been taken up by the women in few pockets as per the survey report undertaken by the researcher. On the other hand, insignificant variation was found in gender work participation in the livestock economy; in non-agricultural activities, there was an enormous gender division of work which was not a good representation. While observing the gender decision making in agriculture, livestock/animal husbandry and in general, religious, social and family affairs, it was governed by men except in child's education, child nurturing, house decoration and in taking marriage decision it was controlled by the women. Better education system focusing on girl's education would help in reducing such gaps. Awareness and training programmes from government's side would add to its advantage.

1. Introduction

With the prevailing system of sex stratification and patriarchal values in the society, women's work and economic contributions are viewed as non-essential and as auxiliary to men's work, though majority of the women are farmers who make agricultural decisions, who do most of the agricultural work and who grow most of the food as their male counterpart migrate to work in mines and construction sites (Constantina Safilios 1985). Women being active participants in the farm production system of North-West hill regions of India, they fully participate in decision-making regarding choice of crops, livestock, credit and farm inputs. In most cases the decision is characterized by family consultation. However, women generally play a greater role in decisions about how much produce is to be stored for

family use over the year ahead and how much is to be sold (Bhati and Singh 1987).

In the North East regions of India, the Mishings women dominated by patriarchal system perform number of works both at home and in the fields (Medhi and Birichi 2009). They do hard labour equal to those of men rather sometimes more than men. Womenfolk perform almost all the work but they have no right to give decision in serious matters inside the house. So, they have less decision-making power in the family matters. They have no right to inherit property. Though women play an important role in every dimension of the society but the multidimensional role played by them in the society are not understood, recognized or acknowledged by the other members of the society (Medhi and Birichi 2009).

In Sikkim, female participation dominance has been seen in most of the activities like feeding of animals, watering of animals, milking and milk disposal, which show the frequency of gender wise participation in different activities. They do participate in decision making of selling of milk/poultry items but dominance of men has been found in decision making of selection of breed of animals, purchasing/selling of livestock and procurement of dry fodder from the market. The main reason behind this is that women have little access to market, so, market related activities remain under men's control and hence, women have been deprived of getting real benefits from livestock. Male participation dominance has been seen in the activities like vaccination and visits to animal hospitals, breeding of animals and health care of animals. (Dwivedy 2014). The lack of cattle ownership and equal access to land and other production resources have made women poor and socioeconomically insecure (Dwivedy 2014).

Rural women performed functions which were both critical and burden-some and they spend 10 to 12 hours per day on household chores, cooking, child care etc., the labour which lacked economic value and hence their contributions remained invisible (Mukherjee 1993; Gopalan 1987). Tiwari (1997) discovered that during the 19th century, it was not a commonly accepted idea that women should go out to earn for the family, but gradually such restrictions lost because of increasing economic pressure and increase in the cost of living. Lollen (2009) revealed that apart from agriculture the people in the Zirdin village in West Siang District in Arunachal Pradesh practiced different types of activities like hunting, fishing, trapping, domestication of animals, handloom and handicraft, collection of forest product etc. to supplement their subsistence. Some people of the village engaged themselves in business and contract work and many of them were also absorbed in the government services as in the study area. There was no specialization of the occupation and every household was a production unit of different items. One man can be engaged in different activities at the same time such as agriculture and other activities like hunting, fishing, domestication of animals, handicraft and handloom etc. The village represented mixed economy. Every household member is engaged in various types of agricultural activities leading to division of labour in agriculture on the basis of age, sex and social norms.

Women comprises 43 percent of the world's agricultural labour force but do not have access and control over all land and productive resources (Nisha Meena 2018). Women perform both economic and non-economic activities within families which most of the time remain invisible (Desai Neera et. al. 2001). Gender differences in work participation and decision making in agricultural activities exist in Sikkim, India (Dwivedy 2014), which is why the

researcher has taken up the present study. Therefore, the main objective of the study is to find the gender differences in work participation and decision making in agricultural and non-agricultural activities in Sikkim.

2. Materials and Methods

The study is solely based on primary sources. The primary data and information were collected from the study area comprising of 212 households. A comprehensive survey was undertaken by using multi stage random sampling method to collect data from four different villages in Sikkim. So, for the study, first state of Sikkim was selected and then categorized into four districts viz., - South, North, East and West. Each district was again divided into blocks namely, Rabong, Chunthang, Martam and Gyalsing. Finally, one village from each block was selected to collect data for the study using complete enumeration method. The four sample villages were Upper Legship village from Rabong block comprising of 46 households, Bop village from Chungthang block consisting of 25 households, Nazitam village from Martam block comprising of 79 households and Lagay village from Gyalshing block containing 62 households. The results were analyzed using descriptive statistics such as percentages, graphical and tabular representation. The statistical software namely Microsoft Excel 2010 had been used for processing, analyzing and finally interpretation of the primary data.

3. Results and Discussion

The Table 1 below shows gender participation in cultivation in the study area. Slight variations are found across the sample villages and across gender in the work participation in the agricultural sector. Even in activities like sowing, weeding, harvesting, threshing and winnowing both male and female participate at par with each other. In plantation crops, male overtakes female marginally while equal participation is observed in the kitchen garden. The outcome is quite motivating which gives an idea that gender differences in work participation in agricultural sector can be eliminated in the near future with government interference and mass awareness.

In Bopp village, ploughing is totally absent due to its rugged terrain as said by the respondents and the concerned panchayat therein. While observing the gender participation in activity such as ploughing in other three sample villages, though it is male dominated, the optimistic scenario is that in recent times, nearly 8 to 9 percent women have started participating in it overcoming the taboo. The participation rate of women in this field can be enhanced through trainings and awareness programmes

The Table 2 above shows gender participation in the livestock/animal husbandry in the study area. A small difference in work participation in the livestock activity is observed across the sample villages and between the males and the females. In Upper Legship and Lagay village, participation of the female is more in activity like cleaning and feeding the animals whereas in Bopp and Nazitam village it is just the opposite. In grazing activity, female participation is somewhat greater in Upper Legship and Lagay village while in Bopp and Naziatm village male outshines. On an average it is found that in activity such as milking, egg collection and selling of products in household premises, female counterpart supersedes the male while in case of selling of products outside and in health care and breeding it is subjugated by the males.

From the above analysis, it is found that women are deprived from engaging in activities which require her movement away from home. While interacting with the respondent, it was found that in some cases, their male counterpart does not allow them due to their suspicious outlook and in other cases it was the lack of education and confidence among the womenfolk which discouraged them from taking part in such activity.

The Table 3 shows gender participation in the non-agricultural activities in the study area. It is seen that in certain activity males outshine while in some occupation female overwhelms. Here in the study area, it is discovered that male colleagues outperform the females in responsibilities such as household and cottage industry, preparation of wood products, homestay and transport while the female associates surpasses the male collaborators in activities connected with shops and restaurants, preparation of beverages, preparation of food products, preparation of decorative items and souvenir. The results are quite disappointing. Huge gender differences occur in the non-agricultural activities in the study area. This is again due to illiteracy, lack of awareness and training, and lack of confidence among the women in the study area.

Gender Decision Making in Agricultural Activities and Societal Affairs

The participation of women in decision making pertaining to farming, village meetings, selling of crops and purchase of animals, orchard plantation and purchase of durables in the two villages from two districts of Odisha viz., Nuasasana and Madhusudanpur were very low (Trivedi 2009). Mishings women perform almost all the work at home and outside but they have no right to give decision in serious matters inside the house. They have less decision-making power in the family matters. (Medhi and Birichi 2009).

Sikkim's women do participate in decision making of selling of milk/poultry items but dominance of men has

been found in decision making of selection of breed of animals, purchasing/selling of livestock and procurement of dry fodder from the market. (Dwivedy 2014).

The Table 4 above discusses on the gender participation and decision-making in agriculture in the study area. It is found that in all the areas whether it is selection of crops of the season to be sown or selection of harvesting time or purchase of agricultural equipment's or selection and procurement of fertilizer or selection and procurement of seeds or selling of crops/cereals/vegetables, men control it though women also participate but her participation is lesser than her counterpart. The reason for such inequality in the study area is due to the existence of patriarchy society which can be eradicated through female education and mass awareness.

The Table 5 above shows gender participation and decision-making in livestock and animal husbandry in the study area. It is learnt that variations occur across the sample villages. In Upper Legship village specifically in making decisions concerning purchasing and selling of the animals and in storage of green fodder for lean period, the female overtakes the male counterpart. The result is quite convincing and, in the days, to come, the other sample villages may also show an upward trend in this field. But on an average, it is seen that men are more participating than the women in decision-making in areas like purchasing and selling of livestock, selection of breed of animals, storage of green fodder for lean period, selling of surplus dry fodder, procurement of dry fodder from the market, selling of green fodder in the market and selling of milk and poultry items.

The Table 6 above discusses on the gender participation and decision making in general, religious, social and family affairs in the study area. In selling and purchasing of land, marketing of household goods, celebrations of festivals and in celebrations of religious festivals male participation in decision making is greater than the female. This is because of the patriarchy society which can be removed through female education and awareness. Equal participation in decision making is observed in health sector and in social and political affairs. Women's participation in decision-making is higher than the menfolk in child's education, child nurturing, house decoration and in taking marriage decision in the family.

This is a positive finding and an indicator to train both men and women accordingly since health, education and political affairs are the backbone of a progressive society.

4. Conclusion

Women in the sample villages in Sikkim participated in agricultural as well as non-agricultural activities at par with her male counterpart. There was not a single activity, which was absolutely dominated by male or female. Ploughing, the activity, which in earlier times, were completely dominated

by men had been taken up by the women in few pockets as per the survey report undertaken by the researcher. It is a positive indication, indeed a success of the women in removing the taboo associated with it and a healthier revolution that will surely lead to a just society where gender division of work does not exist. Therefore, to encourage more women farmers to take up those activities dominated by the males and to eradicate gender division of work, it is very important from the part of the government to conduct relevant awareness and training programmes to uplift those women.

An insignificant variation was found in gender work participation in the livestock economy in the study area. The government can eradicate this problem through various awareness and training programmes targeting the womenfolk.

In non-agricultural activities, there was an enormous gender division of work, which was not a good representation. In activities like preparation of beverages it was absolutely controlled by women while in activities like homestay and transport, it was completely dominated by men. The participation of the women was greater in some activities like operating shops and restaurants, preparing food products, preparing decorative items and souvenir. On the other hand, men's involvement in household and cottage industry and in preparing wood products was greater than women. Such huge gender differences in work are not a healthy scenario. Hence, the government should come up with policies that will favour women to take up activities that was totally male dominated and vice versa. Similarly, awareness and training programme will help in achieving gender equality with greater contribution that will further help in enhancing the economy of the state. The rural women should be given opportunity to take up occupations in transportation and hospitality services which have better economic prospect in the state. For this, the Government should take initiative in framing policy that will favour her and boost her morale and self-confidence to take up such activity.

While observing the gender decision making in agriculture, livestock/animal husbandry and in general, religious, social and family affairs, it was governed by men. Women were deprived from engaging in activities which require her movement away from home. As per the information from the respondent, it was found that in some cases, their male counterpart does not allow them due to their suspicious outlook and in other cases it was the lack of education and confidence among the womenfolk which discouraged them from taking part in such activity. In activities related to child's education, child nurturing, house decoration and in taking marriage decision it was controlled by the women. Better education system focusing on girl's education would help in reducing such gaps.

A mentally, intellectually and economically sound mother can lead to a progressive society since a child's health and education depends on the mother's input on him/her as it is understood from the findings in the study. These qualities in women can be enhanced further through various awareness and training programmes and appropriate policies focusing on economic and social empowerment of a women for which the government and the NGO's should take proper initiatives.

5. Acknowledgments

I would like to express my hearty gratitude to Dr Kul Bahadur Chettri, Assistant Professor, Department of Economics for inspiring and guiding me during this manuscript writing.
